2023 – 24 -114

Introduction

- ❖ We Plan to develop a system for prevent from heat wave impacts in Sri Lanka. There are lot of areas which are facing heat wave impacts in Sri Lanka. There different target groups we are target for this system and they will be the main stakeholders of this system. Through our system we planned to cover heatwave detections and occurring frequencies , health impacts and agricultural based impacts on heatwaves. We plan to develop a mobile application based on machine learning to address these impacts on different target groups.

2023 – 24 -114

Overview

2023 – 24 -114

Research Problem

- ❖ What is the impact of heatwaves on workers' health and safety, and which worker groups are at higher risk of prevalent illnesses and injuries during heatwaves?

The goal of the project is to better understand how heat waves impact worker health and safety in South Australia by comparing the incidence rates of accidents and illnesses during heatwaves and non-heatwave seasons. The study also aims to pinpoint particular demographic and occupational groups that are more susceptible to illnesses and accidents when exposed to high temperatures. In order to inform policymakers and service providers on the essential adaptation and prevention strategies to safeguard vulnerable employees during heatwave occurrences, the study will answer this key research topic.

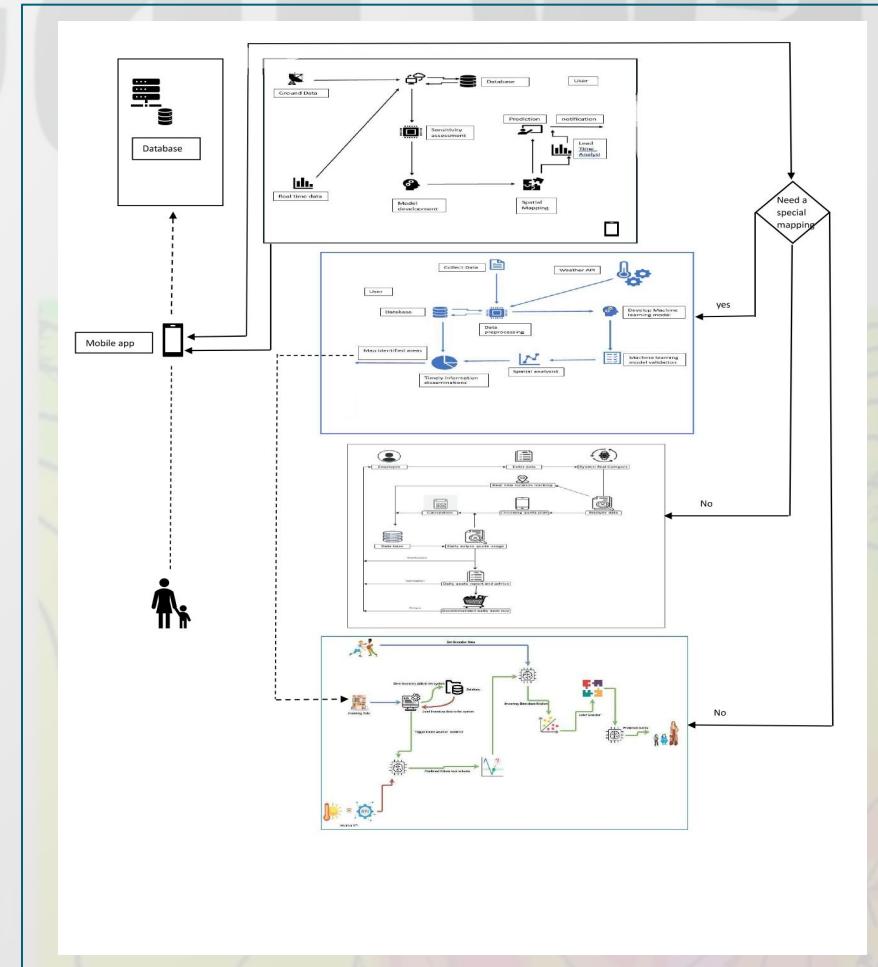

2023 – 24 -114

Specific and Sub Objectives

- ❖ Assess the Impact of Heatwaves on Workers.
- ❖ Identify Vulnerable Worker Groups.
- ❖ Heat wave mapping
- ❖ Give agricultural solutions based on machine learning

2023 – 24 -114

System Architecture

2023 – 24 -114

Soil Moisture Monitoring and Crop Recommendation

IT20142728 | Ranawaka . T. D

**BSc (Hons) in Information Technology
Specializing in Information Technology**

2023 – 24 -114

Introduction

- ❖ The interference of heatwaves are become a critical concern in recent years in various sectors including agriculture in Sri Lanka.
- ❖ Proposed heat resilience solutions with soil damage detection tools are identified as a important sources when it comes to decision making for agricultural field
- ❖ Proposed heat resilience solutions with soil damage detection tools are identified as a important sources when it comes to decision making for agricultural field
- ❖ Proposed heat resilience solutions with soil damage detection tools are identified as a important sources when it comes to decision making for agricultural field
- ❖ Proposed heat resilience solutions with soil damage detection tools are identified as a important sources when it comes to decision making for agricultural field

Research Problem

- ❖ Soil moisture is a significant factor that affects crop development and yield as well as the frequency and severity of heatwaves.

How can machine learning models improve their accuracy and dependability of predicting soil moisture under various climatic and soil conditions?

- ❖ . Using traditional methods is time consuming and not accurate. Training machine learning models are given more accurate and up to date results. This will be very useful when it comes to large areas. This research will provide the solutions for accurate soil moisture forecasting.

How can machine learning models improve their accuracy of predicting competent crops using soil moisture and soil conditions?

Cultivators can anticipate the soil moisture needs of their crops under various temperature conditions, they may better prepare for heat waves and prevent crop losses.

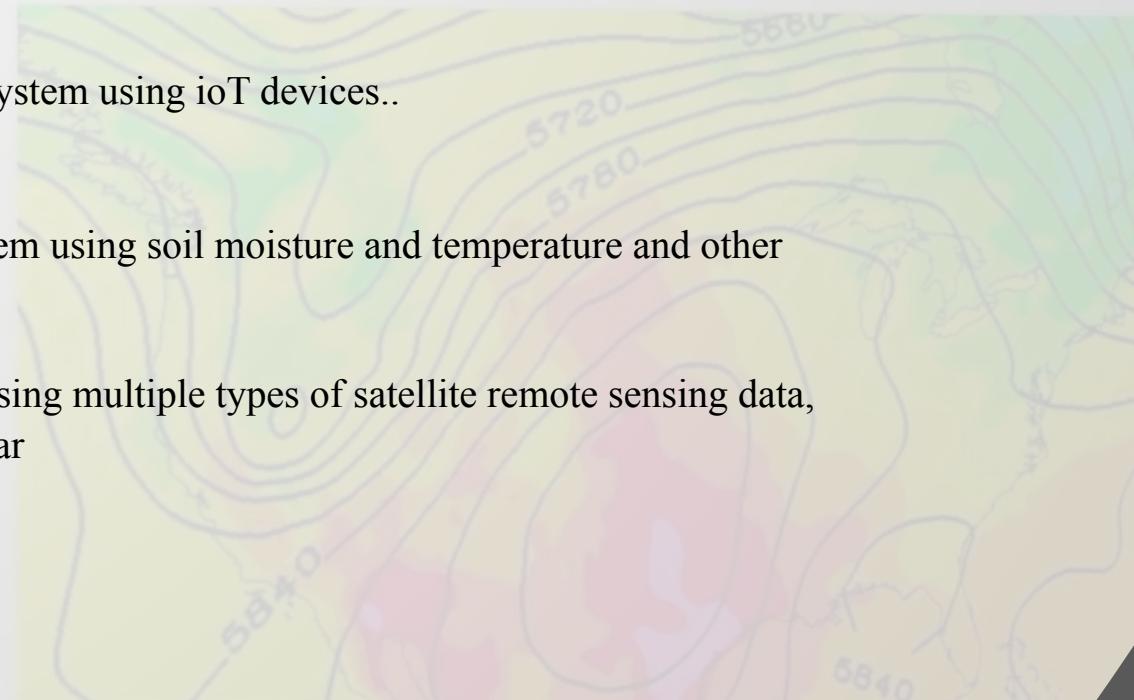

Specific and Sub Objectives

❖ The main objectives of this study are to create a system for monitoring the soil moisture conditions fields in real time of through mobile application. So, the cultivators can easily predict the moisture requirements for their crops and improve their water management efficiency

❖ Make a real time soil monitoring system using IoT devices..

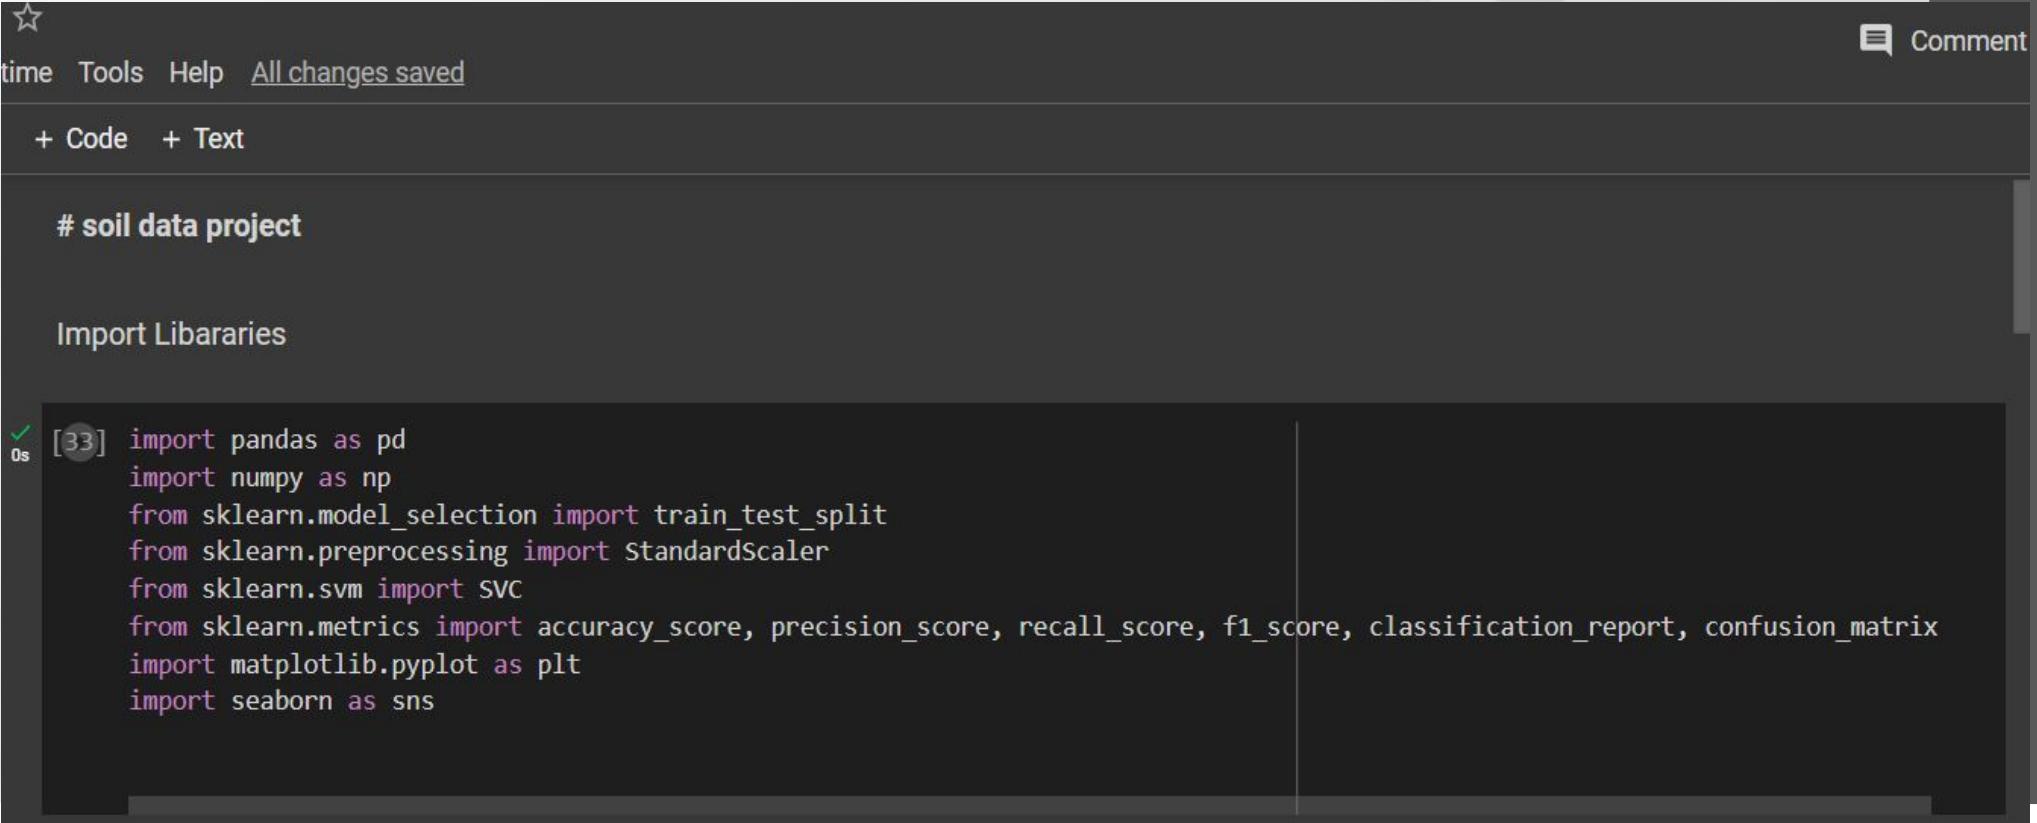

❖ Build a crop recommendation system using soil moisture and temperature and other conditions.

❖ Soil moisture forecasting system using multiple types of satellite remote sensing data, including optical, thermal, and radar

Completion of the Project

Screen Shots

The screenshot shows a Jupyter Notebook interface with a dark theme. At the top, there's a toolbar with a star icon, 'time' (which has a dropdown menu), 'Tools', 'Help', and a status bar indicating 'All changes saved'. To the right of the status bar is a 'Comment' button. Below the toolbar, there are two tabs: '+ Code' and '+ Text', with '+ Code' being active. The main area contains the following code:

```
# soil data project

Carrots
- Text Cell:** split data for training
- Code Cell 36:** x_train, x_test, y_train, y_test = train_test_split(x, y, test_size = 0.25, random_state = 21)
- Code Cell 37:** scaler = StandardScaler()
x_train = scaler.fit_transform(x_train)
x_test = scaler.transform(x_test)
- Code Cell 38:** print(x_train[10])
print(x_test[10])
Output:
[0.36187693 -1.11508028 -0.6560085 0.00389314 -0.85508704 -0.45756494
-1.28580273 0.70136079 -1.86220861]
[0.79496441 -1.0891018 1.78138721 -0.17923014 1.04617834 1.6475031
0.17015565 -0.18109565 0.20947354]
- Code Cell 39:** print(y_train[10])
print(y_test[10])
Output:
Carrots
Sunflowers

Completion of the Project

The screenshot shows a Jupyter Notebook interface with the title "pill_and_crop.ipynb". The notebook has a dark theme and displays the following code:

```
[42] Y_pred = classifier.predict(X_test)
print(np.concatenate((Y_pred.reshape(len(Y_pred),1), Y_test.reshape(len(Y_test),1)),1))

[['Corn' 'Corn']
 ['Cinnamon' 'Cinnamon']
 ['Cinnamon' 'Cinnamon']
 ...
 ['Eggplant' 'Eggplant']
 ['chili' 'chili']
 ['Cinnamon' 'Cinnamon']]]

Calculate accuracy

[43] accuracy = accuracy_score(Y_test, Y_pred)
print(f'Accuracy: {accuracy}')

Accuracy: 0.88976

[44] precision = precision_score(Y_test, Y_pred, average='weighted')
print(f'Precision: {precision}')

Precision: 0.8905634665176148

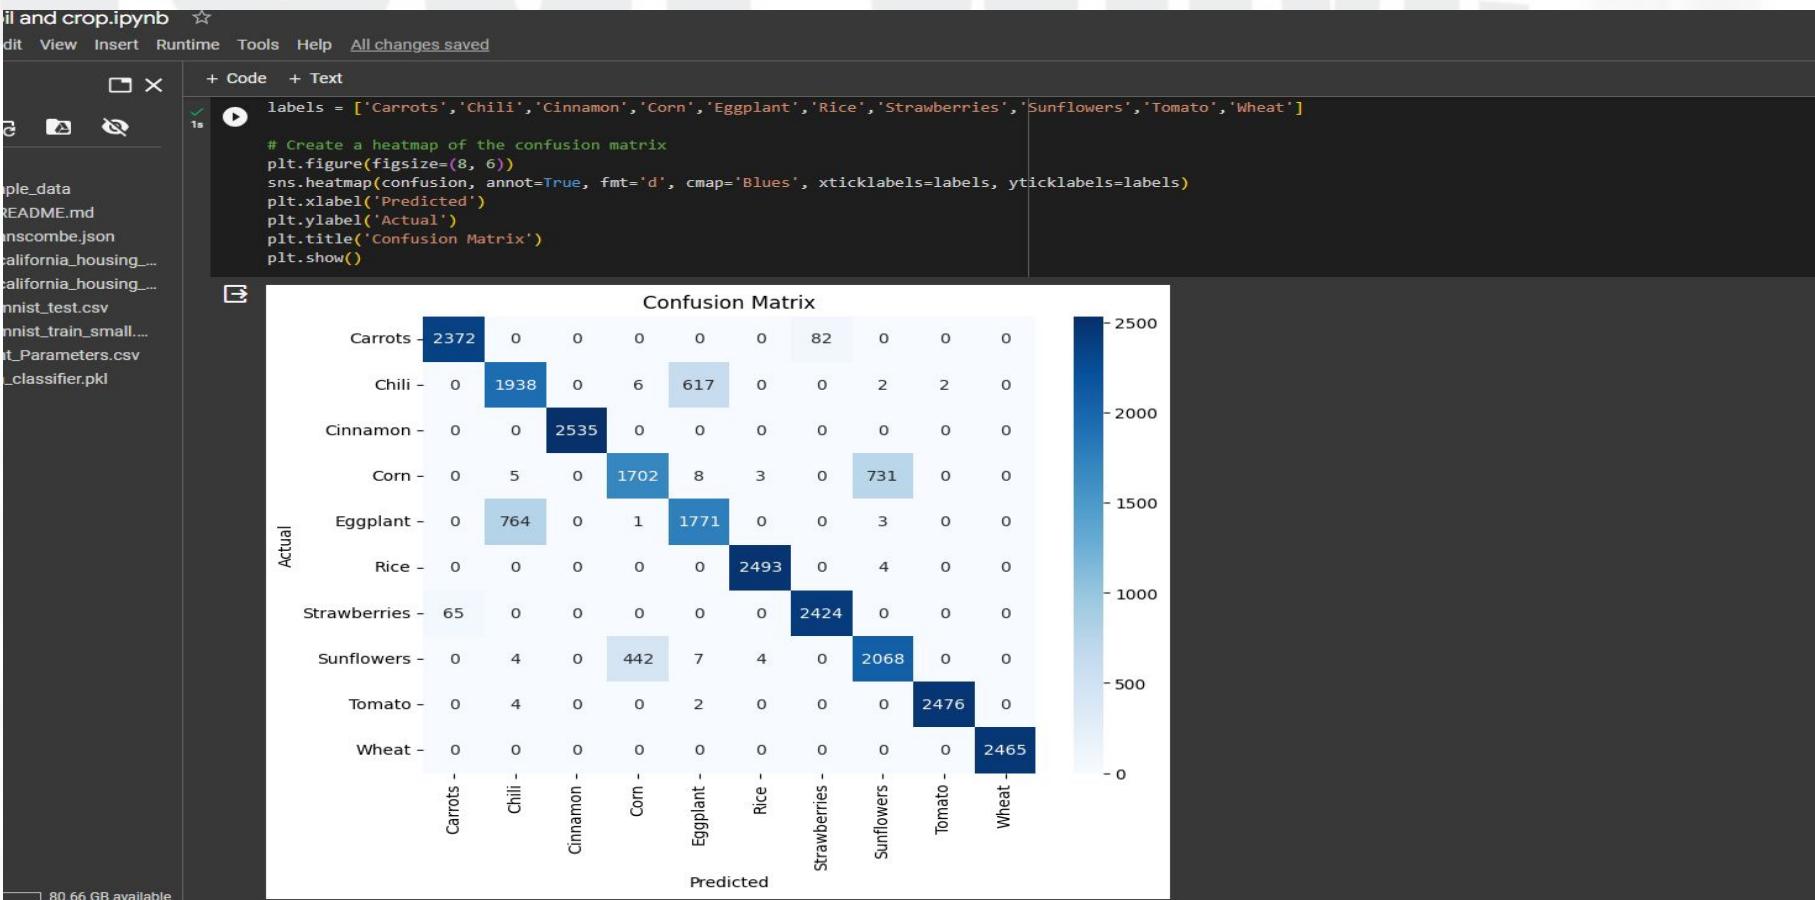

calculate recall

[45] recall = recall_score(Y_test, Y_pred, average='weighted')
print(f'Recall: {recall}')
```

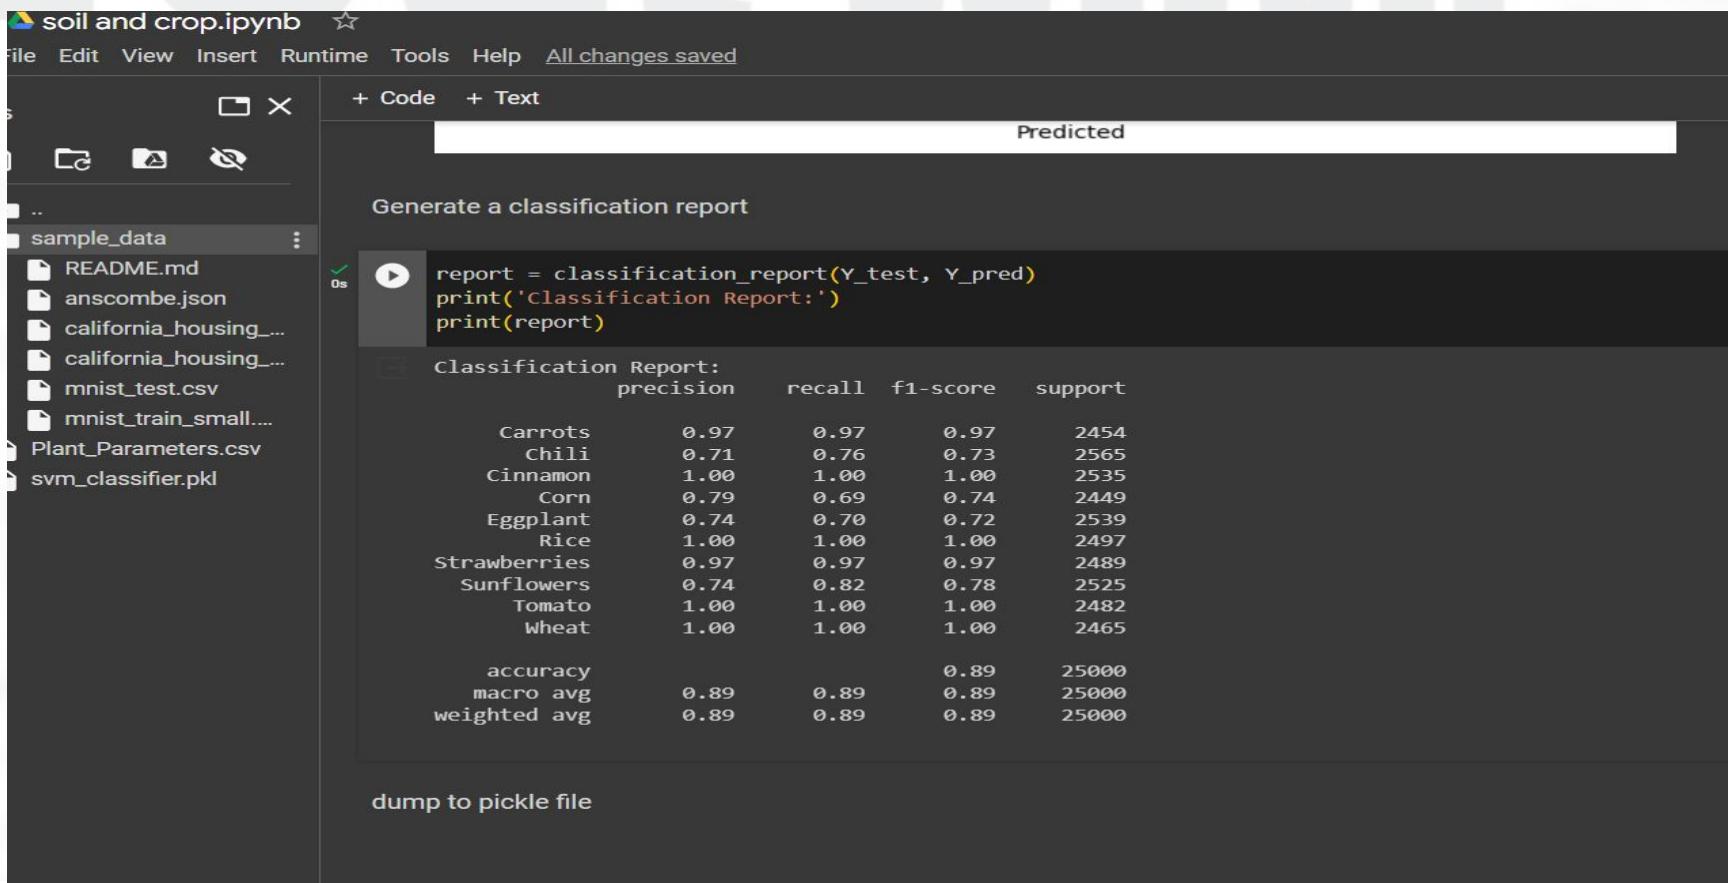

The code performs the following steps:

- Predicts the class for the test data using the classifier.
- Concatenates the predicted classes with the actual test classes.
- Prints the concatenated list of predictions and actual values.
- Calculates the accuracy of the model.
- Prints the calculated accuracy.
- Calculates the weighted precision of the model.
- Prints the calculated precision.
- Calculates the recall of the model.
- Prints the calculated recall.

Completion of the Project

Completion of the Project

The image shows a Jupyter Notebook interface titled "soil and crop.ipynb". The notebook has a dark theme. On the left, there's a sidebar with a file tree containing "sample_data" (with files like README.md, anscombe.json, etc.) and "Plant_Parameters.csv", "svm_classifier.pkl". The main area has tabs for "Code" and "Text", with "Code" selected. A code cell contains the following Python code:

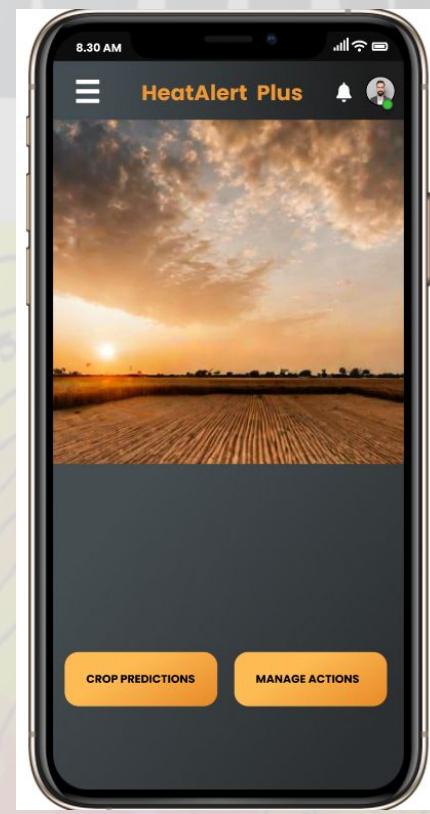

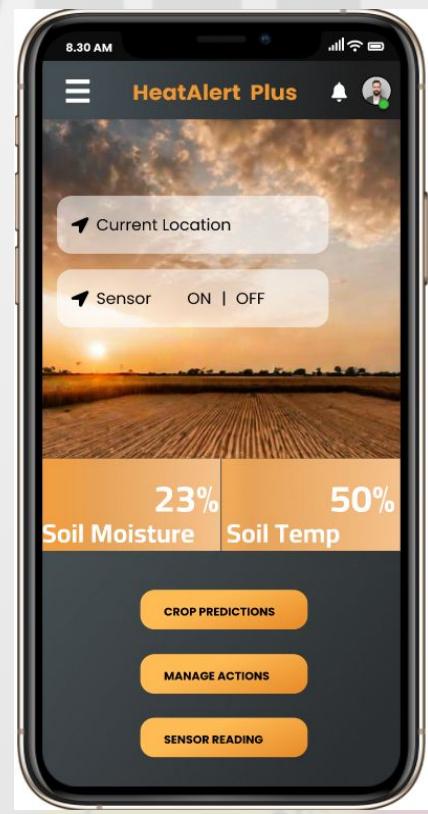

```
report = classification_report(Y_test, Y_pred)
print('Classification Report:')
print(report)
```

Below the code cell, the output is displayed as a table:

	precision	recall	f1-score	support
Carrots	0.97	0.97	0.97	2454
Chili	0.71	0.76	0.73	2565
Cinnamon	1.00	1.00	1.00	2535
Corn	0.79	0.69	0.74	2449
Eggplant	0.74	0.70	0.72	2539
Rice	1.00	1.00	1.00	2497
Strawberries	0.97	0.97	0.97	2489
Sunflowers	0.74	0.82	0.78	2525
Tomato	1.00	1.00	1.00	2482
Wheat	1.00	1.00	1.00	2465
accuracy			0.89	25000
macro avg	0.89	0.89	0.89	25000
weighted avg	0.89	0.89	0.89	25000

At the bottom of the code cell, there's a button labeled "dump to pickle file".

Prototype

Progress at the Moment

Completed

- Collecting Dataset
-
- Data Preparation
-
- Identification of ML Models
-
- User interfaces
-
- IoT sensor build

To Do

- Front End development of mobile App
-
- Soil Forecasting Model development

2023 – 24 -114

Introduction

The escalating frequency and severity of heatwaves on a global scale have become a prominent concern due to their profound implications for human health, infrastructure, and ecosystems. As the world experiences the growing impacts of climate change, the incidence of heatwaves is projected to increase, exacerbating the risks posed to vulnerable populations and underscoring the urgency of effective adaptive measures

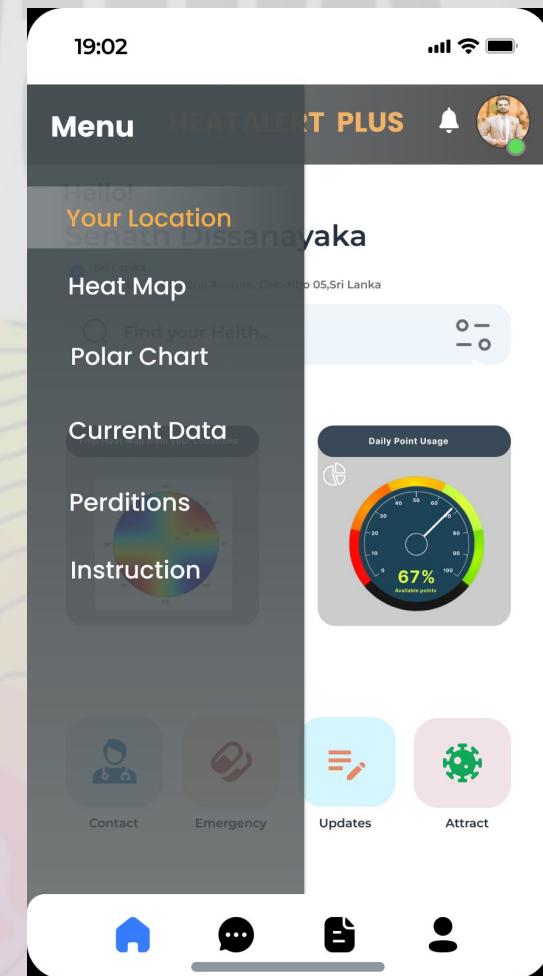

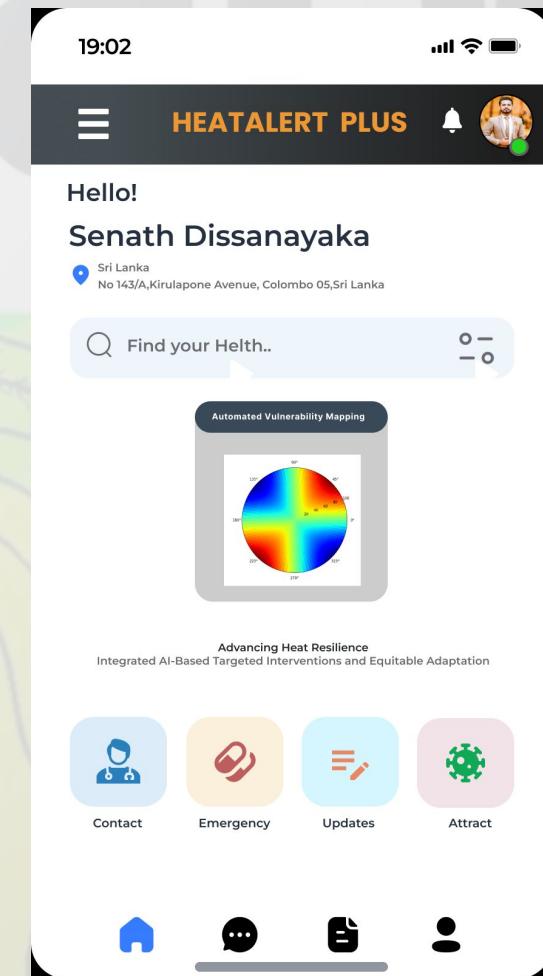

Research Problem

The challenge at the heart of this research subtopic is to develop an automated vulnerability mapping system that effectively identifies and maps areas and populations most susceptible to heat-related risks. While existing research acknowledges the importance of vulnerability assessment, current approaches often rely on manual processes that are time-consuming and resource-intensive. This research seeks to address the limitations of traditional methods by harnessing the power of advanced technologies, such as machine learning and data analytics, to automate the process of vulnerability mapping.

HEATWAVE RISK ASSESSMENT & REAL-TIME MOMENT MANAGEMENT

IT20645366 | Thelwadana. T. M. S. B

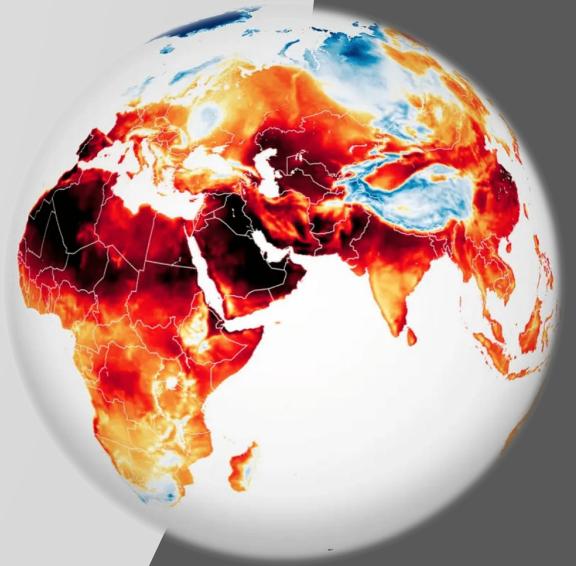

BSc (Hons) in Information Technology
Specializing in Information Technology

2023 – 24 -114

Introduction

- Heatwaves are becoming increasingly common and pose a significant threat to public health, infrastructure, and the environment.
- Many people do not know how to minimize the heat wave effect in different industries or in the behavior of outdoor activities where the heat wave is high.
- They should develop a method to reduce the heat waves received by the body during work and activities.
- Today, we'll present a complete system created to evaluate heatwave risks, offer real-time guidance, and guarantee safety in extreme heat conditions.

Research Problem

- Develop a **point system** based on meteorological data and accurately identify places and people most vulnerable to heat-related hazards.
- The project intends to address issues with data quality, model accuracy, and Scalability as well as making the point system delivery process clear, understandable, and actionable for stakeholders and policy makers.
- “Creating resilient communities capable of proactively adapting to hazards from growing heat waves, ensuring the safety of vulnerable groups and fostering equitable adaptation techniques.”

How to do daily activities in an environment with more heat waves?

Specific and Sub Objectives

Specific Objective

To develop a framework for assessing heat wave risk and a real-time moment management system that combines the safety score system

- Predicting and evaluating the severity of heat waves
- Managing real-time data
- Allocating shelters for efficient response measures
- Safeguarding vital infrastructure during heat waves

Sub Objectives

Specific and Sub Objectives

Data Integration and Analysis

- Historical records and weather data
- Utilize statistical methods and machine learning algorithms.

Model Refinement and Validation

- Create an early warning system using the information from the prediction model

Early Warning System Implementation

- Implement an adaptive system for allocating safety points

Dynamic Safety Point Allocation

- Create intuitive user interfaces providing information about safety points.

Public Awareness and Engagement

- Create a cooperative online platform

Collaborative Stakeholder Platform

- To foresee upcoming heatwave difficulties, use historical data and forecast climatic.

Scenario Planning and Simulation

- Create a feedback loop to continually track the system's performance.

Continuous Monitoring and Improvement

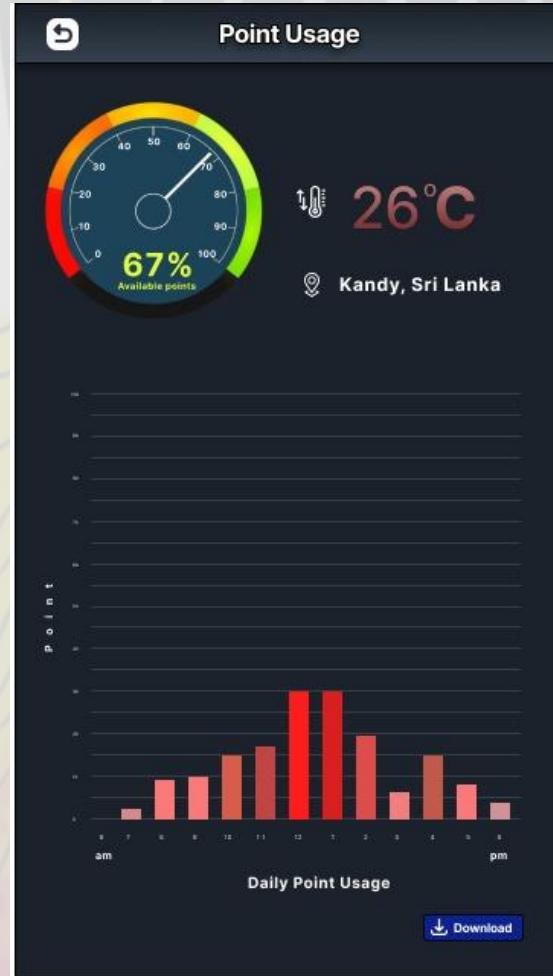

User Interface

Point System UI

User Interface

User can check point usage in here and user can download daily report.

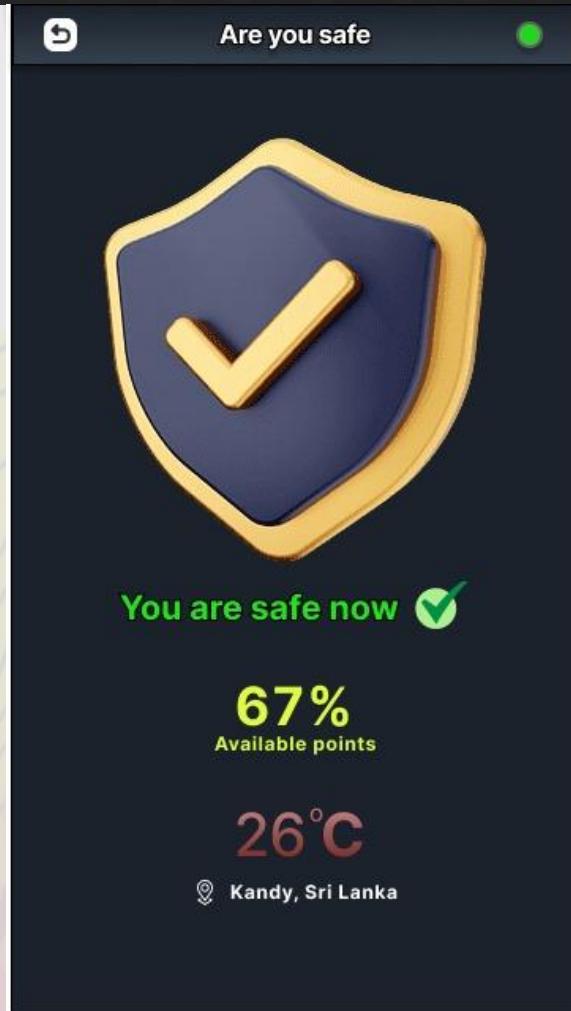

User Interface

User can view notification and warning on here.

User Interface

There are two red and green buttons on the navigation bar. The green button indicates that the user is safe and the red button indicates that the user is not safe.

User Interface

Advice for travelers is shown here. You can use each advice when you want to use it. if you want to more advice click see more button.

When collecting data and providing advice to travelers heading to heat wave areas, it's crucial to gather information that will help you offer the most relevant guidance. Here's a list of key questions to include in a traveler's...

What is your travel area?

What dates are you traveling?

Travel duration ?

Group Size?

Accommodation Type?

Transportation type?

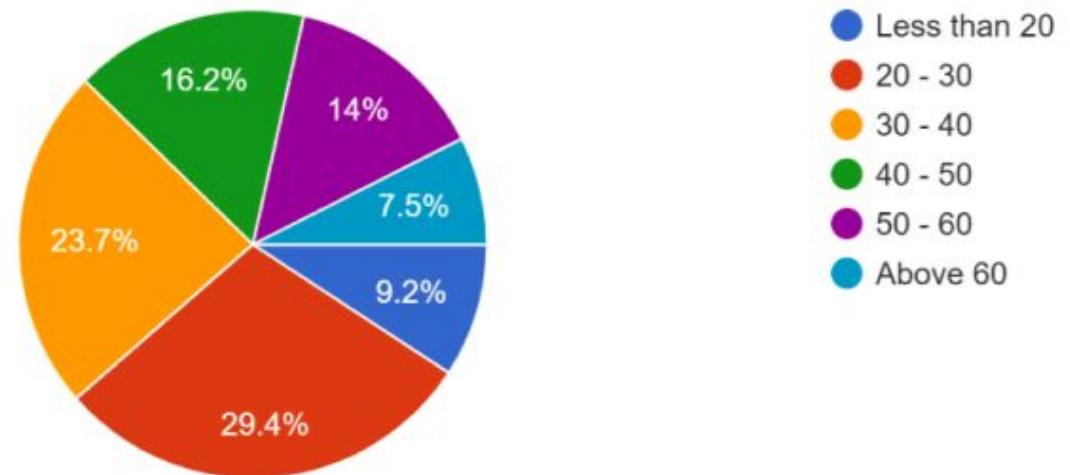

Submit

Research Respondents' Age Category Analysis

The most common age category of the research respondents was 20-30 which had 29.4% participants. The age category of 30-40 had 23.7% respondents which was the second highest.

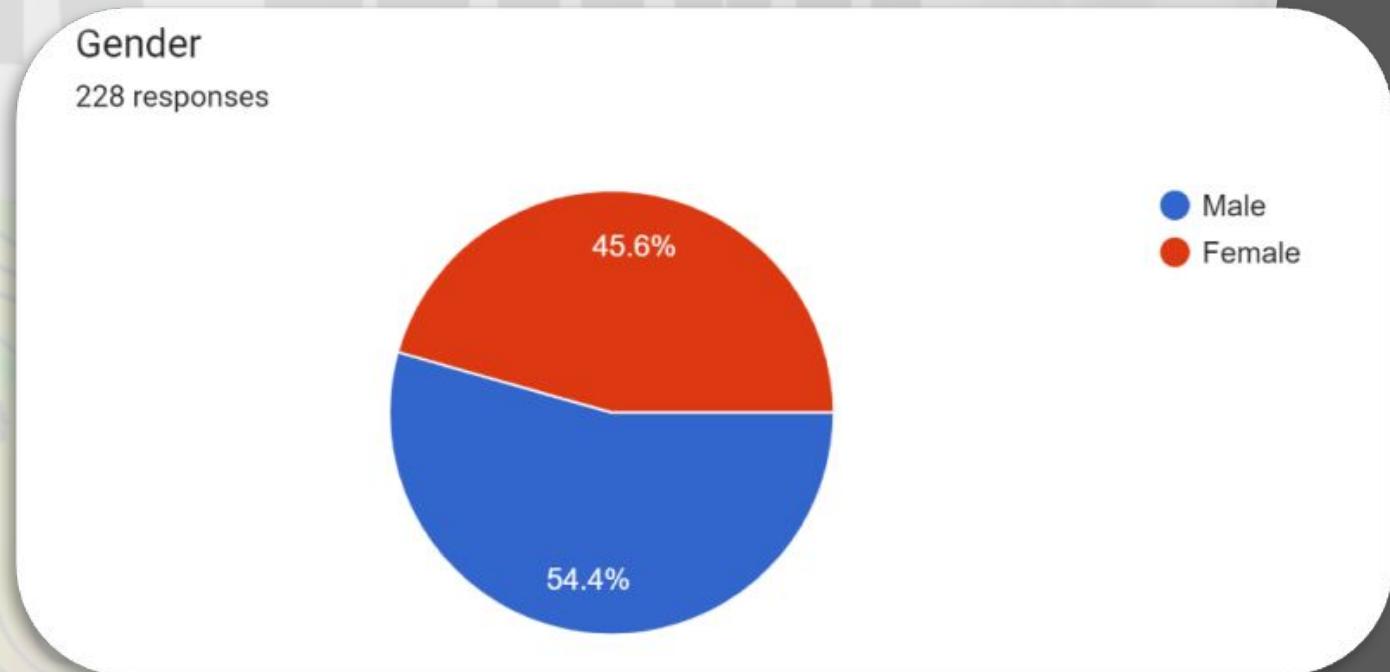

Age category

228 responses

Research Respondents' Gender Analysis

Male respondents show a higher percentage (54.4%) here.

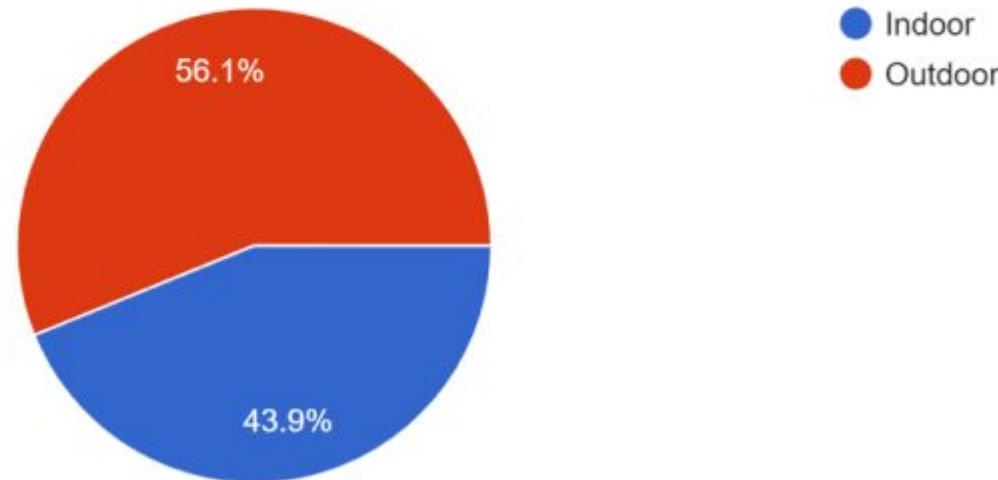

What type of work are you doing?

It shows that more percentage (56.1%) of respondents work outdoors.

What type of work are you doing?

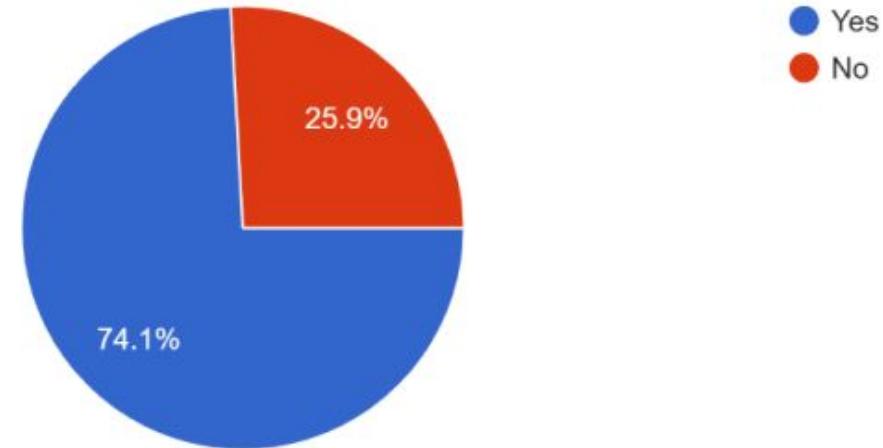

228 responses

Specific Outdoor Activities Analysis

74.1% of respondents are engaged in specific outdoor work.

Do you engage in any specific outdoor activities during the heat wave event?
228 responses

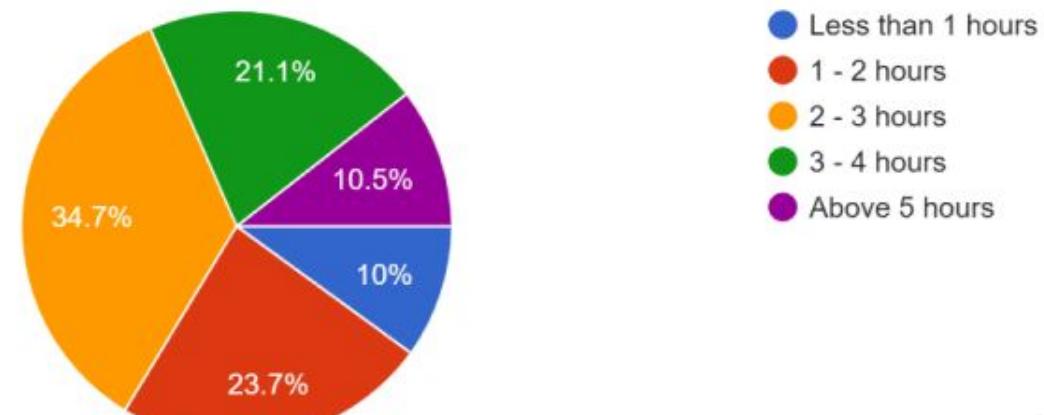

Duration Analysis

34.7% of respondents indicate that they are engaged in 2-3 hours of work.

If yes, please describe the activities and their duration:

190 responses

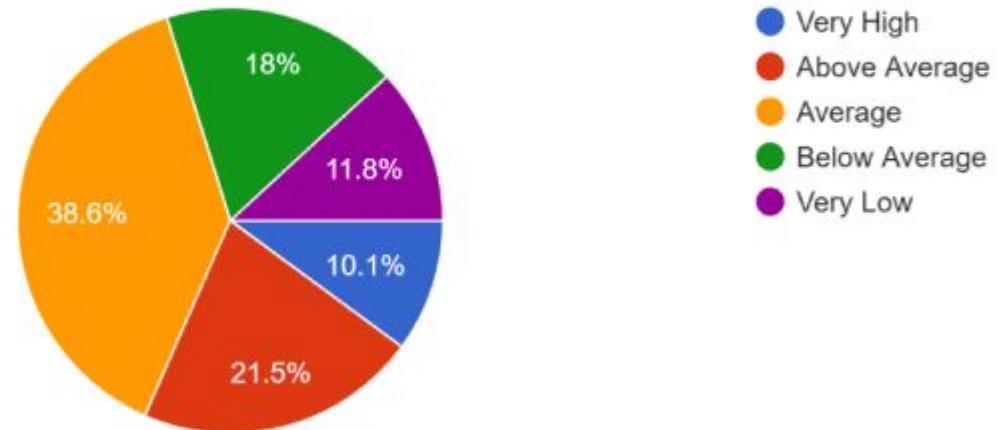

Area Analysis

38.6% of the respondents indicate that the area they work in is average.

Your opinion of a heat wave event in your area?

228 responses

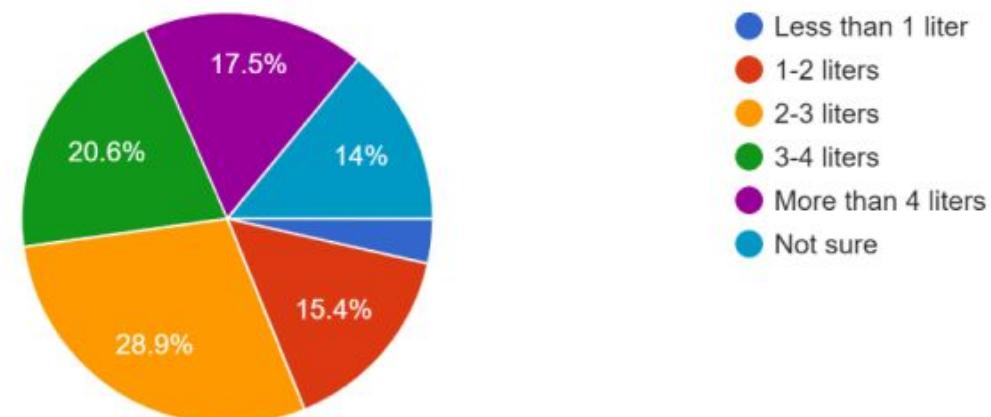

Analysis of water Intake

28.9% of the respondents indicate that they drink water.

How much water does one person drink per day?

228 responses

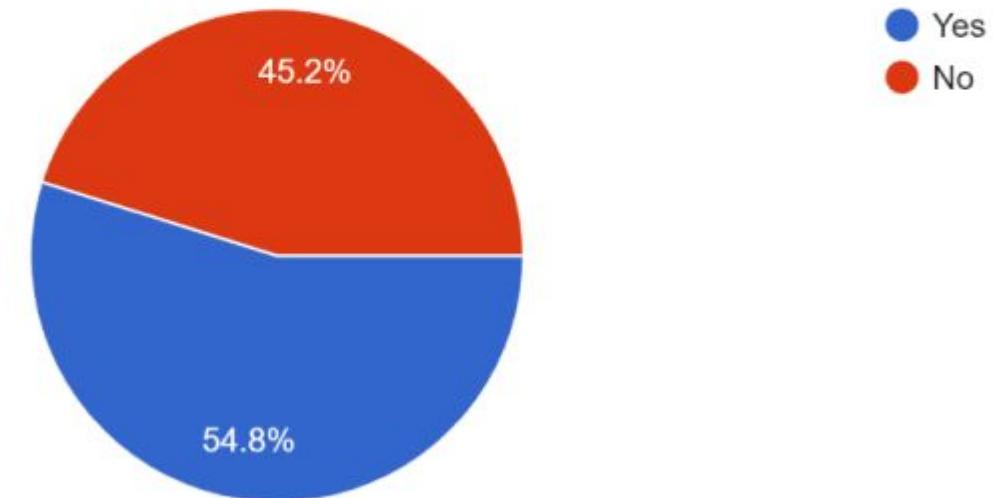

Safety Measures for medical problems Analysis

It shows that 54.8% of the respondents use safety measure.

Do you follow safety measures for medical problems caused by waves?

228 responses

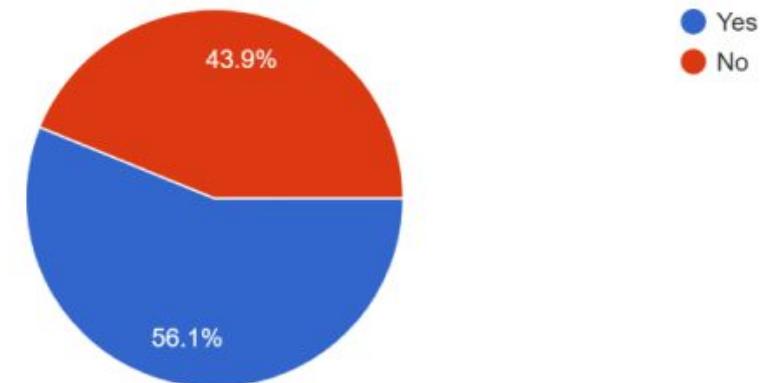

Use a GPRS Tracking System Analysis

It shows that 56.1% of the respondents use GPRS tracking system.

Do you use a GPRS tracking system for your daily activities through a mobile device or smart watch?

228 responses

Thank
